USE FOR RESEARCH PURPOSES ONLY

Unless otherwise specified expressly on the packaging, all products sold hereunder are intended for and may be used for research use only. Not for use in diagnostic procedures. Purchase does not include any right or license to use, develop or otherwise exploit these products commercially. Any commercial use, development or exploitation of these products or development using these products without the express written authorization of Enzo Life Sciences, Inc. is strictly prohibited. Buyer assumes all risk and liability for the use and/or results obtained by the use of the products covered by this invoice whether used singularly or in combination with other products.

LIMITED WARRANTY; DISCLAIMER OF WARRANTIES

These products are offered under a limited warranty. The products are guaranteed to meet all appropriate specifications described in the package insert at the time of shipment. Enzo Life Sciences' sole obligation is to replace the product to the extent of the purchasing price. All claims must be made to Enzo Life Sciences, Inc., within five (5) days of receipt of order. THIS WARRANTY IS EXPRESSLY IN LIEU OF ANY OTHER WARRANTIES OR LIABILITIES, EXPRESS OR IMPLIED, INCLUDING WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON- INFRINGEMENT OF THE PATENT OR OTHER INTELLECTUAL PROPERTY RIGHTS OF OTHERS, AND ALL SUCH WARRANTIES (AND ANY OTHER WARRANTIES IMPLIED BY LAW) ARE EXPRESSLY DISCLAIMED.

TRADEMARKS AND PATENTS

Several Enzo Life Sciences products and product applications are covered by US and foreign patents and patents pending. Enzo is a trademark of Enzo Life Sciences, Inc.

FOR RESEARCH USE ONLY.
NOT FOR USE IN DIAGNOSTIC PROCEDURES.

Please read entire booklet before proceeding with the assay.

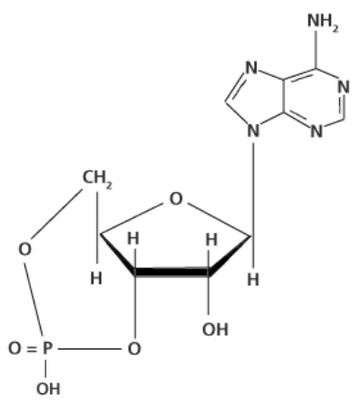
TABLE OF CONTENTS

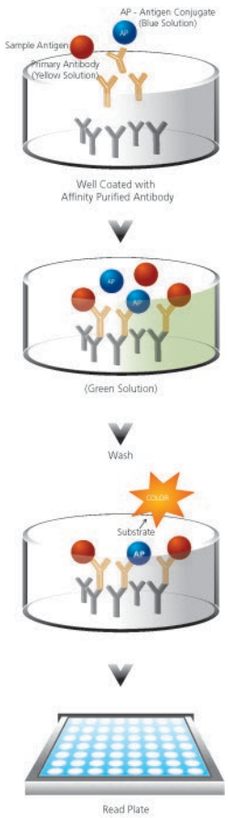
INTRODUCTION

The cyclic AMP Complete Enzyme-linked Immunosorbent Assay (ELISA) kit is a competitive immunoassay for the quantitative determination of cyclic AMP in cell and tissue lysates with HCl, in addition to plasma, saliva, serum and culture supernatants. The optional acetylated assay format provides an approximate 10-fold increase in sensitivity and is ideal for samples with extremely low levels of cAMP. If expected levels of cAMP are unknown, the investigator may evaluate a few samples in the non-acetylated format in order to determine if higher sensitivity is required.

Adenosine 3', 5'-cyclic monophosphate (cyclic AMP; cAMP) is one of the most important "second messengers" involved as a modulator of physiological processes [5]. cAMP is also involved in regulating neuronal, glandular, cardiovascular, immune and other functions [6-9]. A number of hormones are known to activate cAMP through the action of the enzyme adenylate cyclase which converts ATP to cAMP. These hormones include a variety of anterior pituitary peptide hormones such as corticotropin (ACTH), glucagon, calcitonin, thyroid stimulating hormone (TSH), and luteinizing hormone (LH). Because cAMP has been shown to be involved in the cardiovascular and nervous systems, immune mechanisms, cell growth and differentiation, and general metabolism[10-12], there remains considerable interest in the measurement of intracellular cAMP in tissues and cell cultures. The investigation of cAMP may help to provide a clearer understanding of the physiology and pathology of many disease states.

cyclic AMP





PRINCIPLE

1. Standards and samples are added to wells coated with GxR IgG antibody. A blue solution of cAMP conjugated to alkaline phosphatase is then added, followed by a yellow solution of rabbit polyclonal antibody to cAMP.
2. During a simultaneous incubation at room temperature the antibody binds, in a competitive manner, the cAMP in the sample or conjugate. The plate is washed, leaving only bound cAMP.
3. pNpp substrate solution is added. The substrate generates a yellow color when catalyzed by the alkaline phosphatase on the cAMP conjugate.
4. Stop solution is added. The yellow color is read at 405nm. The amount of signal is indirectly proportional to the amount of cAMP in the sample.

MATERIALS SUPPLIED

1. **Assay Buffer 2 Concentrate, 100mL**
   Component Number 80-0074
   A 2X solution of sodium acetate buffer containing proteins and sodium azide.

2. **0.1M HCl, 100mL**
   Component Number 80-0082
   0.1M hydrochloric acid in water

3. **cAMP Standard, 3 x 0.5mL**
   Component Number 80-0056
   A solution of 2,000 pmol/mL cyclic AMP.

4. **Acetylation Kit, 2 x 2 vials**
   Component Number 950-001
   a. **Triethylamine**
      2 mL, Component Number 80-0063
   b. **Acetic Anhydride**
      1 mL, Component Number 80-0064

5. **Goat anti-Rabbit IgG Clear Microtiter Plate**
   One plate of 96 wells, Component Number 80-0060
   Five plates of break-apart strips coated with a goat anti-rabbit polyclonal antibody.

Do not mix components from different kit lots or use reagents beyond the expiration date of the kit.

Avoid contamination by endogenous alkaline phosphatase. Do not expose reagents or supplies to bare skin.

6. **Neutralizing Reagent, 27mL**
   Component Number 80-1476
   A proprietary solution used to neutralize HCl.

7. **cAMP Antibody, 25mL**
   Component Number 80-3001
   A yellow solution of rabbit polyclonal antibody to cAMP.

Activity of conjugate is affected by concentrations of chelators > 10mM (such as EDTA and EGTA).

8. **cAMP Conjugate, 25mL**
   Component Number 80-3003
   A blue solution of cAMP conjugated to alkaline phosphatase.

9. **Wash Buffer Concentrate, 10mL**
   Component Number 80-1287
   A 20X solution of tris buffered saline containing detergents.

Stop solution is caustic. Use caution and keep tightly capped.

10. **pNpp Substrate, 100 mL**
    Component Number 80-0076
    A solution of p-nitrophenyl phosphate.

11. **Stop Solution, 27 mL**
    Component Number 80-0248
    A solution of trisodium phosphate in water.

This kit uses break-apart microtiter strips, which allow the user to measure as many samples as desired. Unused wells must be kept desiccated at 4°C in the sealed bag provided. The wells should be used in the frame provided.

12. **cAMP Assay Layout Sheet, 1 each**
    Component Number 30-0360

13. **Plate sealer, 5 each**
    Component Number 30-0012

STORAGE

All components of this kit, **except the Conjugate and Standard**, are stable at 4ºC until the kit's expiration date. The Conjugate and Standard should be stored at -20ºC upon receipt.

OTHER MATERIALS NEEDED

1. Deionized or distilled water.
2. Precision pipets for volumes between 1 µL and 1,000 µL.
3. Repeater pipet for dispensing 50 µL and 200 µL.
4. Disposable beakers for dilution buffer concentration.
5. Graduated cylinders.
6. Microplate shaker.
7. Lint-free paper toweling for blotting.

8. Microplate reader capable of reading at an optical density of 405nm.
9. Triton X-100 (optional for sample preparation)
10. Liquid nitrogen, mortar & pestle and concentrated HCl (optional – for tissue samples).

Samples must be stored at or below -20°C to avoid loss of bioactive analyte. Avoid repeated freeze/ thaw cycles.

SAMPLE HANDLING

Treatment of cells and tissue with HCl will stop endogenous phosphodiesterase activity and allow for the direct measurement of these samples in the assay without evaporation or further processing. Recommended treatment protocols follow. Samples containing rabbit IgG will interfere with the assay. EDTA plasma may precipitate during acetylation.

Please note that some samples may contain high levels of cAMP and additional dilution may be required. Samples with low levels of cAMP may be assayed in the acetylated format or the samples may be concentrated. Tissue and cell lysates should be diluted in HCl, when necessary, and run directly in the assay. When using the non-acetlyated protocol, a minimum 1:4 dilution is required for both tissue and cell lysates. When using the acetylation protocol, a minumum 1:32 dilution is required for both tissue and cell lysates.

If buffers other than those provided are used in the assay, the end-user must determine the appropriate dilution and assay validation.

Biological fluids should be diluted in Assay Buffer 2 and run directly in the assay. When using the non-acetylation protocol, a minimum 1:16 dilution is required for plasma, a 1:64 dilution for serum, a 1:16 dilution for saliva. When using the acetylation protocol, a minimum 1:64 dilution is required for both plasma and serum and a 1:2 dilution for saliva. Culture supernatant, diluted in both assay buffer and tissue culture media, has also been validated for use in this kit. When using the non-acetylation protocol, neat culture supernatant can be used. When using the acetylation protocol, a minimum 1:4 dilution is required.

Please see Sample Recoveries section for detailed information. These are the minimum dilutions required to remove matrix interference of these samples.

SAMPLE RECOVERIES

Linearity

Plasma, saliva and serum were diluted to their respective minimum recommended dilutions (MRD), spiked with cAMP and serially diluted 1:2 in Assay Buffer. Neat culture supernatant was spiked with cAMP and serially diluted in both assay buffer (AB) and tissue culture media (TCM). For the acetylated samples, plasma and serum were diluted to their respective MRDs, spiked with cAMP, acetylated and serially diluted 1:2 in Assay Buffer. Additionally, saliva with endogenous levels of cAMP high enough to be read in the assay was diluted to its MRD and then serially diluted 1:2 in Assay Buffer. Acetylated culture supernatant was diluted 1:4, spiked with cAMP and serially diluted in both AB and TCM. All samples were run in the assay and compared to the standard curve.

Cell and tissue lysates were diluted to their respective minimum recommended dilutions (MRD), spiked with cAMP and serially diluted 1:2 in 0.1M HCl. For the acetylated samples, cell and tissue lysates were diluted to their respective MRDs, spiked with cAMP, acetylated and serially diluted 1:2 in 0.1M HCl. All samples were run in the assay and compared to the standard curve.

Results for both the non-acetylated and acetylated samples are shown in the tables below.

Dilutional Linearity, % (non-acetylated)

Spike and Recovery

cAMP was spiked at three concentrations into human plasma, saliva and serum at their respective MRDs. For the acetylated samples, cAMP was spiked at the same three concentrations into human plasma, saliva and serum at their respective MRDs, acetylated and run in the assay. Matrix background was subtracted and the recovery was compared to the recovery of cAMP spiked into Assay Buffer. The average percent recovery for each matrix at the minimum recommended dilution is indicated below.

cAMP was spiked at three concentrations into cell and tissue lysates at their respective MRDs. For the acetylated samples, cAMP was spiked at the same three concentrations into cell and tissue lysates at their respective MRDs, acetylated and run in the assay. Matrix background was subtracted and the recovery was compared to the recovery of cAMP spiked into 0.1M HCl. The average percent recovery for each matrix at the minimum recommended dilution is indicated below.

Results for both non-acetylated and acetylated samples are shown in the tables below.

Sample (non-acetylated)	Spike Concentration, pmol/mL	% Recovery	Minimum Recommended Dilution
EDTA plasma	200	93	1:16
	50	152	
	20	136	
Saliva	200	115	1:16
	50	113	
	20	114	
Serum	200	123	1:64
	50	161	
	20	115	

Sample (acetylated)	Spike Concentration, pmol/mL	% Recovery	Minimum Recommended Dilution
EDTA plasma	20	85	1:64
	5	76	
	2	116	
Saliva	20	85	1:2
	5	112	
	2	193	
Serum	20	90	1:64

	20	110	

Sample (acetylated)	Spike Concentration, pmol/mL	% Recovery	Minimum Recommended Dilution
Cell lysate	20	97	1:32
	5	94	
	2	150	
Tissue lysate	20	131	1:32
	5	150	
	2	146	
Tissue lysate, treated	20	112	1:32
	5	150	
	2	139	

Parallelism

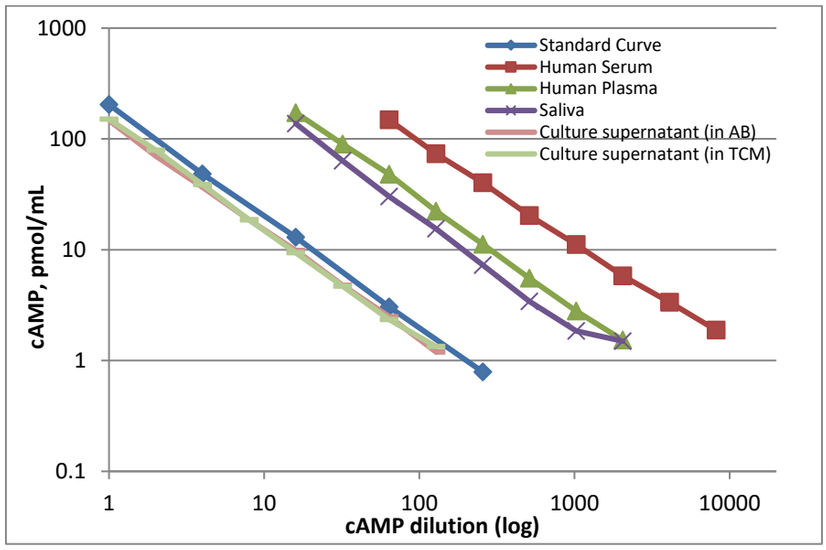
To assess parallelism, human EDTA plasma, saliva and serum samples were spiked with cAMP at their respective MRDs and serially diluted in assay buffer. Neat culture supernatant was spiked with cAMP and serially diluted in both AB and TCM for the non-acetylation protocol. When acetylated, the culture supernatant was diluted 1:4, spiked with cAMP and serially diluted in both AB and TCM.

Cell and tissue lysates were spiked with cAMP at their respective MRDs and serially diluted in 0.1M HCl.

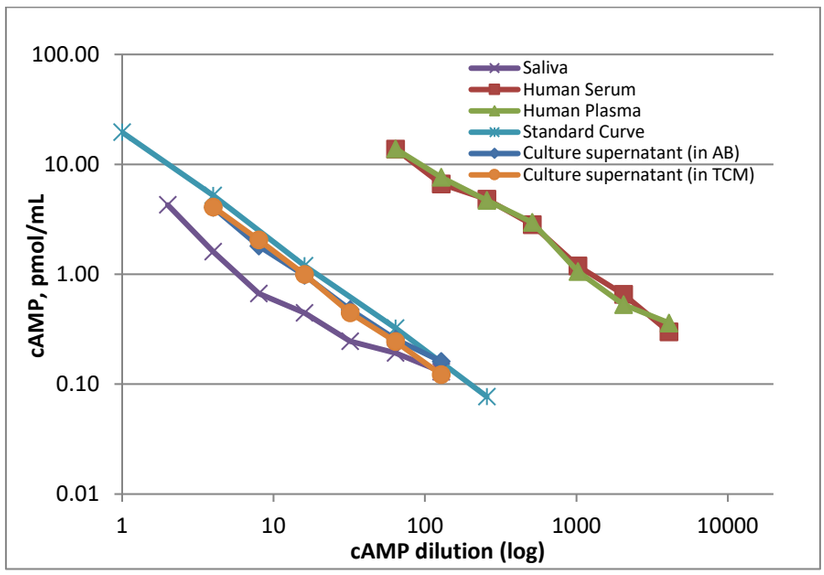
All of the samples were then run in the assay. The cAMP concentration in each sample was determined from the standard curve. Concentrations were plotted as a function of sample dilution. Parallelism of the curves demonstrates that the antigen binding characteristics are similar enough to allow the accurate determination of native analyte levels in diluted samples matrices.

Results for both the regular protocol and the acetylation protocol are shown in the graphs below.

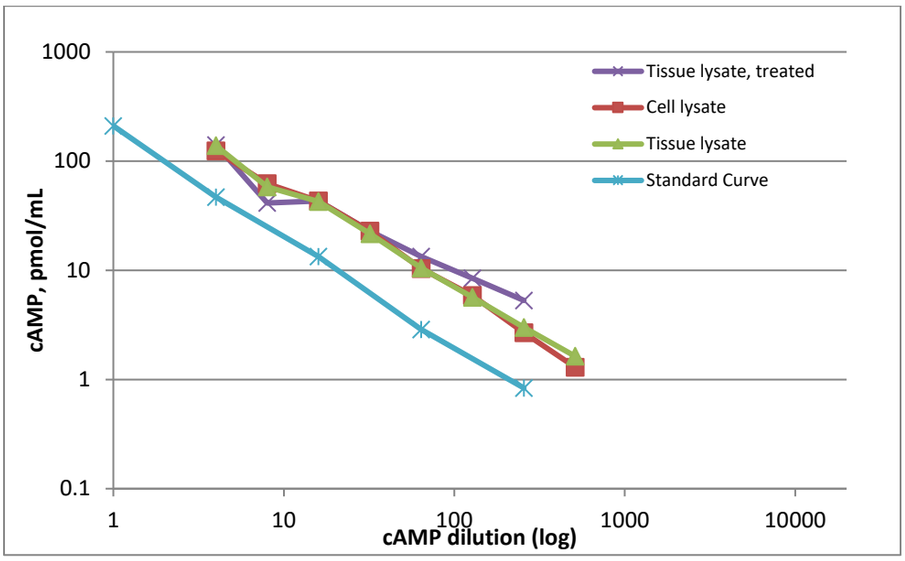
Non-acetylated assay format (plasma, saliva, serum and culture supernatant)



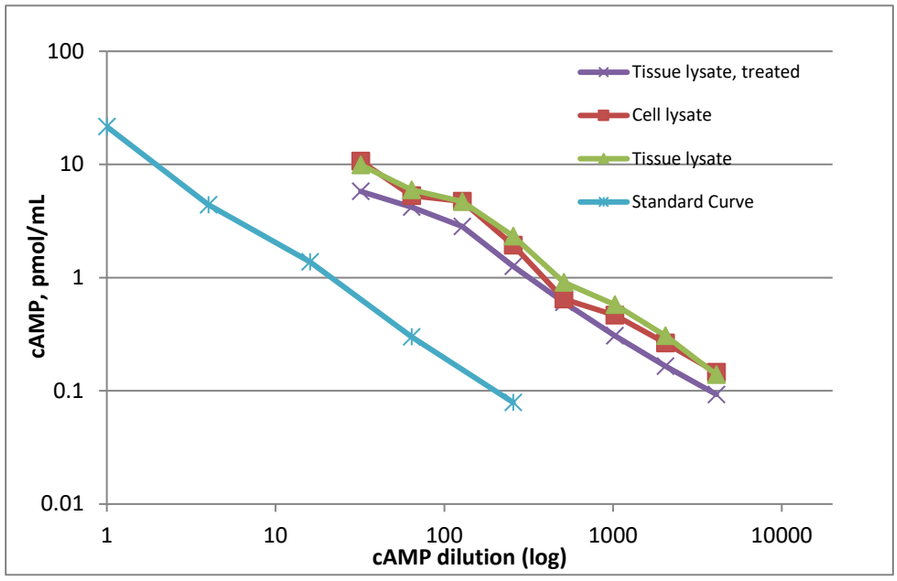
Acetylated assay format (plasma, saliva, serum and culture supernatant)



Non-acetylated assay format (cell and tissue lysates)



Acetylated assay format (cell and tissue lysates)



PROTOCOL FOR CELL LYSATES

The concentration of cells used must be optimized for the specific cell line and treatment conditions. Cells may be grown in typical containers such as Petri dishes, culture plates (e.g., 48-well, 12-well, or 96-well), culture flasks, etc. Some cells are particularly hardy (e.g., bacteria) and may require the addition of 0.1 to 1% Triton X-100 to the 0.1M HCl for enhanced lysis. If Triton X-100 is added to samples it should also be added to the standard dilution as a modest increase in optical density may occur.

1. Pellet **suspension cells** and aspirate the media. Treat cells with 0.1M HCl. A general starting concentration of 1 x 10^6 cells per mL of 0.1M HCl is recommended. Remove the media from **adherent cells** and add enough 0.1M HCl to cover the bottom of the plate. Avoid over-diluting the sample with an excessive volume of HCl. Please note that the culture media may be saved and assayed separately, if desired.
2. Incubate the cells in 0.1M HCl for 10 minutes at room temperature.
3. Inspect the cells under a microscope to ensure uniform lysis. Continue incubating for an additional 10 minutes, if necessary.
4. Centrifuge ≥600 x g to pellet the cellular debris.
5. The supernatant may be assayed immediately or stored frozen for later analysis.

   Note: Standards must be diluted in 0.1 M HCl and Neutralizing Reagent used.

PROTOCOL FOR TISSUE SAMPLES

1. After collection, tissue samples should be flash frozen in liquid nitrogen. If analysis cannot be carried out immediately, store tissue at -80˚C.
2. Grind frozen tissue to a fine powder under liquid nitrogen in a stainless steel mortar.
3. When liquid nitrogen has evaporated, weigh the frozen tissue and homogenize in 10 volumes of 0.1M HCl (e.g., 0.1 g of tissue should be homogenized in 1 mL of 0.1M HCl).
4. Centrifuge ≥600 x g to pellet the debris (~10 minutes).
5. The supernatant may be further diluted in the 0.1M HCl provided and run directly in the assay or stored frozen for later analysis.

REAGENT PREPARATION

1. **Assay Buffer 2**

   Just before use, prepare the assay buffer by diluting 50 mL of the supplied Assay Buffer 2 Concentrate with 50 mL of deionized water. Discard unused buffer or add up to 0.09% sodium azide (w/v) for storage.

2. **Wash Buffer**

   Prepare the wash buffer by diluting 10 mL of the supplied Wash Buffer Concentrate with 190 mL of deionized water. This can be stored at room temperature until the kit expiration, or for 3 months, whichever is earlier.

3. **cAMP Standard, non-acetylated format**

   Allow the 2,000 pmol/mL standard stock to warm to room temperature. Label five 12mm x 75mm tubes #1 through #5. Pipet 900 µL of Assay Buffer 2 or 0.1M HCl into tube #1. Pipet 750 µL of Assay Buffer 2 or 0.1M HCl into tubes #2 through #5. Add 100 µL of the 2,000 pmol/mL standard stock into tube #1 and vortex thoroughly. Add 250 µL of tube #1 to tube #2 and vortex thoroughly. Add 250 µL of tube #2 to tube #3 and vortex thoroughly. Continue this for tubes #4 through #5.

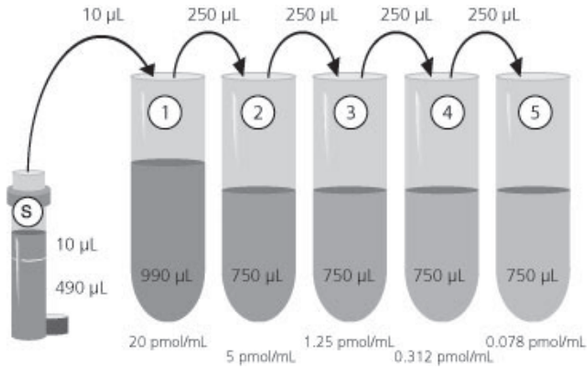
   Diluted standards should be used within 60 minutes of preparation. The concentrations of cAMP in the tubes are labeled above.

4. **Acetylation Reagent (optional)**

   Prepare the Acetylating Reagent by adding 0.5 mL of Acetic Anhydride to 1 mL of Triethylamine. Note that this volume is sufficient to add to 30 mL of diluted standards and samples. Use the prepared reagent within 60 minutes of preparation. Discard any unused portion of the Acetylating Reagent.

Triethylamine and acetic anhydride are lachrymators. Caution - corrosive, flammable, and harmful vapor.

5. **cAMP Standard, acetylated format (optional)**



Allow the 2,000 pmol/mL standard stock to warm to room temperature. Label five 12mm x 75mm tubes #1 through #5. Pipet 990 µL of Assay Buffer 2 or 0.1M HCl into tube #1. Pipet 750 µL of Assay Buffer 2 or 0.1M HCl into tubes #2 through #5. Add 10 µL of the 2,000 pmol/mL standard stock into tube #1 and vortex thoroughly. Add 250 µL of tube #1 to tube #2 and vortex thoroughly. Add 250 µL of tube #2 to tube #3 and vortex thoroughly. Continue this for tubes #4 through #5.

Acetylate all **standards and samples** by adding 10 µL of the Acetylating Reagent for each 200 µL of the standard or sample. Add the Acetylating Reagent directly to the diluted standard or sample and vortex immediately after the addition of the Acetylating Reagent.

Label one 12mm x 75mm tube as the Bo/NSB tube. Pipet 1 mL of Assay Buffer 2 into this tube. Add 50 µL of the Acetylating Reagent to the Bo/NSB tube and use in Steps 2 and 3 of the Assay Procedure.

The acetylated standards should be used within 30 minutes of preparation. The concentrations of cAMP in the tubes are labeled above.

ASSAY PROTOCOL

Bring all reagents to room temperature for at least 1 hour prior to use.

Refer to the Assay Layout Sheet to determine the number of wells to be used. Remove the wells not needed for the assay and return them, with the desiccant, to the mylar bag and seal. Store unused wells at 4°C.

Note: If the acetylated format of the assay is to be run, all standards, samples, and the diluent for the NSB and Bo wells must be section. Acetylated standards and samples must be used within 30 minutes.

1. If using samples prepared in 0.1M HCl, pipet 50 µL of Neutralizing Reagent into each well except for the Total Acitivty (TA) and Blank wells. Do not add Neutralizing Reagent for the other sample diluent options.

All standards and samples should be run in duplicate.

Pipet the reagents to the sides of the wells to avoid possible contamination.

Prior to the addition of substrate, ensure there is no residual wash buffer in the wells. Remaining wash buffer may cause variation on assay results

2. Pipet 100 µL of appropriate standard diluent (Assay Buffer 2, 0.1M HCl or non-conditioned culture media) into the NSB (non-specific binding) and Bo (0 pmol/mL standard) wells.
3. Add 50 µL of Assay Buffer 2 to the NSB wells.
4. Pipet 100 µL of Standards #1 through #5 to the bottom of the appropriate wells.
5. Pipet 100 µL of the samples to the bottom of the appropriate wells.
6. Pipet 50 µL of the blue conjugate into each well except the TA and Blank wells.
7. Pipet 50 µL of the yellow antibody into each well except the Blank, TA, and NSB wells.

   Note: Every well used should be green in color except the NSB wells which should be blue. The Blank and TA wells are empty at this point and have no color.
8. Seal the plate. Incubate for 2 hours on a plate shaker (~500 rpm) at room temperature.
9. Empty the contents of the wells and wash by adding 400 µL of wash buffer to every well. Repeat 2 more times for a total of 3 washes. After the final wash, empty or aspirate the wells and firmly tap the plate on a lint free paper towel to remove any remaining wash buffer.
10. Pipet 5 µL of the blue conjugate to the TA wells.
11. Add 200 µL of the substrate solution into each well.
12. Incubate for 1.5 hours at room temperature with shaking.
13. Pipet 50 µL stop solution into each well.
14. After blanking the plate reader against the substrate blank, read optical density at 405 nm. If plate reader is not capableof adjusting for the blank, manually subtract the mean OD of the substrate blank from all readings.

CALCULATION OF RESULTS

Several options are available for the calculation of the concentration of cAMP in the samples. We recommend that the data be handled by an immunoassay software package utilizing a 4 parameter logistic (4PL) curve fitting program. The concentration of cAMP can be calculated as follows:

1. Calculate the average net OD for each standard and sample by subtracting the average NSB OD from the average OD for each standard and sample.

   Average Net OD = Average OD - Average NSB OD

2. Using data analysis software, plot the Average Net OD for each standard versus cAMP concentration in each standard. Samples with concentrations outside of the standard curve range will need to be reanalyzed using alternative dilution(s).

To normalize for protein content, divide the resulting picomole per mL determinations (pmol/mL) by the total protein concentration (mg/mL) in each sample. This is expressed as pmol cAMP per mg of total protein.

TYPICAL RESULTS

The results shown below are for illustration only and should not be used to calculate results.

Non-acetylated assay format in Assay Buffer 2

Sample	Mean OD	Net OD	%B/Bo	cAMP (pmol/mL)
TA	--	0.172	--	--
NSB	0.102	--	--	--
Bo	1.123	1.021	--	0

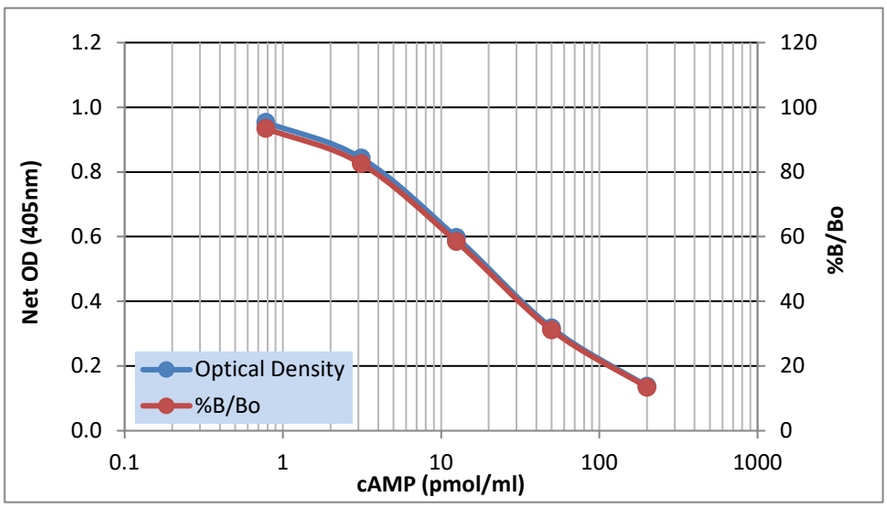
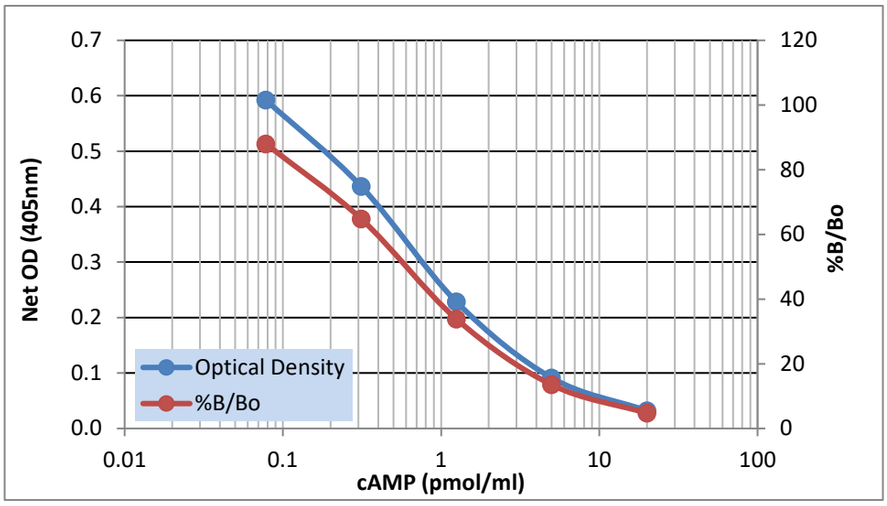
TYPICAL STANDARD CURVES

Typical standard curves are shown below. These curves must not be used to calculate cAMP concentrations; each user must run a standard curve for each assay.

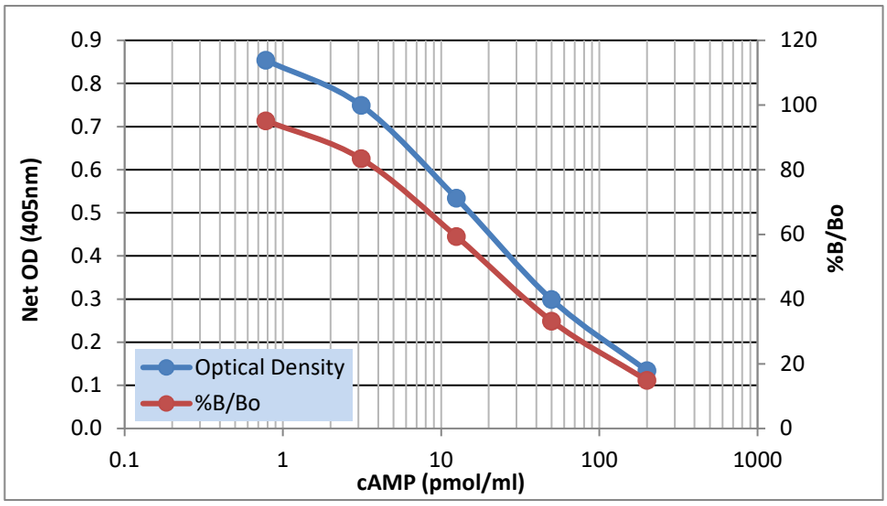
Non-acetylated assay format in Assay Buffer 2



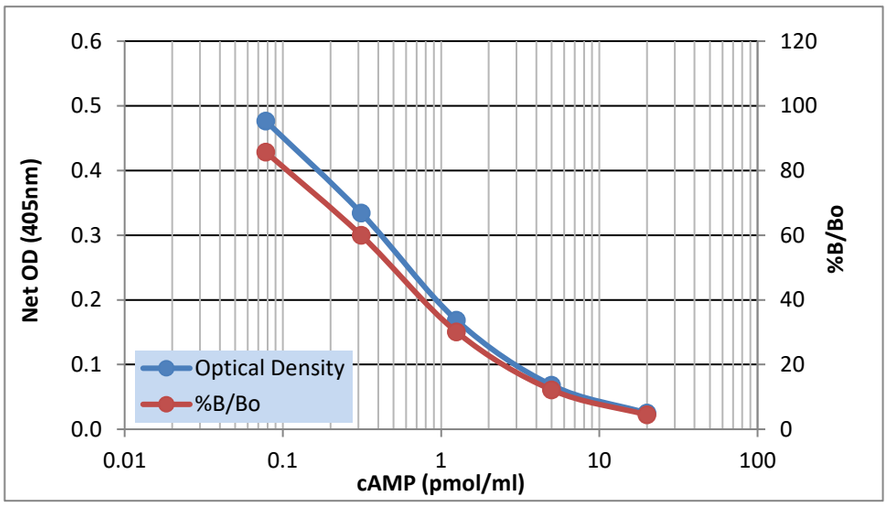
Acetylated assay format in Assay Buffer 2



Non-acetylated assay format in 0.1M HCl



Acetylated assay format in 0.1M HCl



PERFORMANCE CHARACTERISTICS

Specificity

The specificity of the assay was determined by running serial dilutions of the analytes, including the cross-reactants, in the assay, fitting the resulting dose response curves to a 4PL curve-fit and determining the ED_{50}. The ED_{50} of each cross-reactant was then divided by the determined ED_{50} of the cAMP standard curve and multiplied by 100.

Analyte	Cross Reactivity, %
cAMP	100
AMP	<0.001
ATP	<0.001
cGMP	<0.001
GMP	<0.001
GTP	<0.001
cUMP	<0.001
CTP	<0.001

Sensitivity

Assay Buffer 2

The sensitivity of the assay, defined as the concentration of cAMP measured at 2 standard deviations from the mean of 18 zeros along the standard curve, was determined to be 0.49 pmol/mL in the non-acetylated assay format and 0.027 pmol/mL in the acetylated assay format.

0.1M HCl

The sensitivity of the assay, defined as the concentration of cAMP measured at 2 standard deviations from the mean of 18 zeros along the standard curve, was determined to be 1.18 pmol/mL in the non-acetylated assay format and 0.006 pmol/mL in the acetylated assay format.

Precision

Assay Buffer 2

Intra-assay was determined by assaying 20 replicates of three buffer controls containing cAMP in a single assay.

Non-Acetylated Format		Acetylated Format	
pmol/mL	**%CV**	**pmol/mL**	**%CV**
20	4.19	2	4.32
5	11.94	0.5	5.42
2	13.38	0.2	5.91

Inter-assay was determined by measuring buffer controls of varying cAMP concentrations in multiple assays over several days.

Non-Acetylated Format		Acetylated Format	
pmol/mL	**%CV**	**pmol/mL**	**%CV**
20	8.1	2	8.94
5	10.41	0.5	10.77
2	10.99	0.2	12.18

0.1M HCl

Intra-assay was determined by assaying 20 replicates of three 0.1M HCl controls containing cAMP in a single assay.

Non-Acetylated Format		Acetylated Format	
pmol/mL	**%CV**	**pmol/mL**	**%CV**
20	3.08	2.0	4.09
5	11.59	0.5	4.41
2	6.13	0.2	6.14

Inter-assay was determined by measuring 0.1M HCl controls of varying cAMP concentrations in multiple assays over several days.

Non-Acetylated Format		Acetylated Format	
pmol/mL	**%CV**	**pmol/mL**	**%CV**
20	10.68	2.0	18.69
5	11.94	0.5	13.29
2	13.95	0.2	12.92
