**Introduction**

17β-Estradiol (E2) is a female sex steroid hormone produced mainly in the ovaries, by the placenta during pregnancy, and to a lesser extent in the adrenal cortices, testes, and peripheral tissues\(^1-3\). The hormone is synthesized enzymatically from acetate, cholesterol, progesterone and testosterone\(^1\). In addition to estradiol’s well described anatomic and physiological regulation of reproduction\(^2-3\) and secondary sex characteristics, it also influences diverse activities such as bone growth, brain development and maturation, and the intracellular concentration of calcium\(^4\) and certain second messenger molecules\(^5\). For an extensive review of the non-reproductive actions of estradiol see the Ciba Foundation Symposium, 1995.

![Estradiol-17β](image)

**Principle**

1. Standards and samples are added to wells coated with a Dxs IgG antibody. A blue solution of estradiol-17β conjugated to alkaline phosphatase is then added, followed by a yellow solution of sheep polyclonal antibody to estradiol-17β.

2. During a simultaneous incubation at room temperature the antibody binds in a competitive manner, the estradiol-17β in the sample or conjugate. The plate is washed, leaving only bound estradiol-17β.

3. pNpp substrate solution is added. The substrate generates a yellow color when catalyzed by the alkaline phosphatase on the estradiol-17β conjugate.

4. Stop solution is added. The yellow color is read at 405 nm. The amount of signal is indirectly proportional to the amount of estradiol-17β in the sample.
**Materials Supplied**

1. **Assay Buffer Concentrate Low BSA**
   - 27 mL, Product No. 80-2088
   - Tris buffer containing proteins and sodium azide

2. **17β-Estradiol Standard**
   - 2 x 0.5 mL each, Product No. 80-0114
   - A solution of 300,000 pg/mL Estradiol-17β

3. **Donkey anti-Sheep IgG Microtiter Plate**
   - Five plates of 96 wells, Product No. 80-0045
   - A clear plate of break-apart strips coated with a donkey anti-sheep polyclonal antibody

4. **Estradiol-17β Antibody**
   - 27 mL, Product No. 80-2089
   - A yellow solution of sheep polyclonal antibody to Estradiol-17β

5. **Estradiol-17β Conjugate**
   - 27 mL, Product No. 80-2090
   - A blue solution of Estradiol-17 conjugated to alkaline phosphatase

6. **Wash Buffer Concentrate**
   - 100 mL, Product No. 80-1287
   - Tris buffered saline containing detergents

7. **pNpp Substrate**
   - 100 mL, Product No. 80-0076
   - A solution of p-nitrophenyl phosphate

8. **Stop Solution**
   - 27 mL, Product No. 80-0248
   - A solution of trisodium phosphate in water

9. **Estradiol-17β Complete Assay Layout Sheet**
   - 1 each, Product No. 30-0281

10. **Plate Sealer**
    - 5 each, Product No. 30-0012

---

Do not mix components from different kit lots or use reagents beyond the expiration date of the kit.

The standard should be handled with care due to the known and unknown effects of the antigen.

Avoid contamination by endogenous alkaline phosphatase. Do not expose reagents or supplies to bare skin.

Activity of conjugate is affected by concentrations of chelators > 10 mM (such as EDTA and EGTA).

Stop solution is caustic. Keep tightly capped.

The standard should be handled with care due to the known and unknown effects of the antigen.

Avoid contamination by endogenous alkaline phosphatase. Do not expose reagents or supplies to bare skin.
**Storage**

The Estradiol-17β Antibody and Conjugate are stable at -20°C. All other components of this kit are stable at 4°C until the kit’s expiration date. The Antibody and Conjugate should be stored at -20°C upon receipt.

**Materials Needed but Not Supplied**

1. Deionized or distilled water
2. Precision pipets for volumes between 5 µL and 1,000 µL
3. Repeater pipet for dispensing 50 µL and 200 µL
4. Disposable beakers for diluting buffer concentrates
5. Graduated cylinders
6. Microplate shaker
7. Lint-free paper toweling for blotting
8. Microplate reader capable of reading at 405 nm
9. 200 mg C18 solid phase system columns (Burdick & Jackson recommended)
10. Vacuum manifold
11. Speedvac
12. 100% Methanol
13. Diethyl Ether
14. Data reduction software capable of analyzing data, preferably with a 4 parameter logistic curve fit.
Sample Handling

For an accurate determination of total estradiol-17β concentration in serum and plasma samples, extract samples prior to assaying. A minimum 1:2 and 1:4 dilution is required for serum and plasma, respectively, after extraction. These are the minimum dilutions required to remove matrix interference in the assay. Pregnancy samples should be diluted at least 1:32 after extraction. This was the minimum dilution required due for samples to read within the linear range of the assay.

Samples with low levels of estradiol-17β may be concentrated during the extraction procedure. For example, extracting 1 mL of sample and reconstituting with 0.25 mL of the assay buffer would concentrate the sample 4 times.

Either liquid-liquid extraction or solid phase extraction methods may be used. Solid phase extraction allows for higher throughput sample processing with the use of a vacuum manifold and speedvac.

Solid Phase Extraction

Materials Needed:

1. Estradiol-17β standard to allow extraction efficiency to be accurately determined. An extraction efficiency protocol is available on our website.
2. 200 mg C₁₈ solid phase system columns (Burdick & Jackson recommended)
3. Vacuum manifold
4. Speedvac
5. 100% Methanol
6. Diethyl Ether
7. dH₂O

Procedure:

1. Condition 200 mg C₁₈ solid phase system columns on a vacuum manifold by passing 5-10 mL of 100% methanol through the columns, followed by 5-10 mL of dH₂O.
2. Apply serum and plasma samples.
3. Wash columns with 5-10 mL dH₂O. Allow water to drain completely from columns until dry.
4. Elute samples with 2 mL of diethyl ether.
5. Dry samples down in a speedvac for 2-3 hrs.
6. Rehydrate samples at room temperature in the assay buffer. A minimum of 250 µL of the assay buffer is recommended for reconstitution to allow for duplicate sample measurement.
Liquid-Liquid Extraction

Materials Needed:
1. Estradiol-17β standard to allow extraction efficiency to be accurately determined. An extraction efficiency protocol is available on our website.
2. Diethyl Ether
3. Speedvac
4. dH₂O

Procedure:
1. Add diethyl ether to serum or plasma samples at a 5:1 (v/v) ether:sample ratio.
2. Mix solutions by vortexing for 2 minutes.
3. Allow phases to separate for 2 minutes.
4. Transfer organic phase to a glass test tube containing 1 mL dH₂O.
5. Vortex the mixture for 2 minutes, and allow phases to separate for 2 minutes.
6. Transfer organic phase to a clean glass test tube, and dry samples down using a speed vac for 2-3 hours.
7. Rehydrate samples at room temperature in the assay buffer. A minimum of 250 µL of the assay buffer is recommended for reconstitution to allow for duplicate sample measurement.

Sample Recoveries

The Estradiol-17β standard was diluted to 100 pg/mL in the assay buffer. This sample was extracted per the above solid phase extraction procedure using a 200 mg column, and then run in the assay. The mean result was 97.9 pg/mL for 98% extraction efficiency.
Reagent Preparation

1. **Assay Buffer**
   Prepare the Assay Buffer by diluting 10 mL of the supplied Assay Buffer Concentrate with 90 mL of deionized water. This can be stored at room temperature until the kit expiration, or for 3 months, whichever is earlier.

2. **Wash Buffer**
   Prepare the wash buffer by diluting 5 mL of the supplied Wash Buffer Concentrate with 95 mL of deionized water. This can be stored at room temperature until the kit expiration, or for 3 months, whichever is earlier.

3. **Estradiol-17β Standard**
   Allow the 300,000 pg/mL 17β-Estradiol standard to come to room temperature and vortex prior to use. Label seven 12 x 75 mm tubes #1 through #7 and one tube “int”. Pipet 990 µL assay buffer into tube “int” and 800 µL into tube #1. Pipet 500 µL assay buffer into tubes #2 through #7. Remove 10 µL from the stock vial and add to tube “int” and vortex thoroughly. Remove 400 µL from tube “int” and add to tube #1 and vortex thoroughly. Remove 500 µL form tube #1 and add to tube #2. Vortex thoroughly. Continue this from tubes #3 through #7.

Diluted standards should be used within 60 minutes of preparation. The concentrations of Estradiol-17β in the tubes are labeled above.

4. **Conjugate 1:2 Dilution for Total Activity Measurement**
   Prepare the Conjugate 1:2 Dilution by diluting 50 µL of the supplied Conjugate with 50 µL of Assay Buffer. The dilution should be used within three hours of preparation. This 1:2 dilution is intended for use in the Total Activity wells ONLY.
Prior to the addition of substrate, ensure there is no residual wash buffer in the wells. Remaining wash buffer may cause variation in assay results.

Assay Procedure

Refer to the Assay Layout Sheet to determine the number of wells to be used. Remove the wells not needed for the assay and return them, with the desiccant, to the mylar bag and seal. Store unused wells at 4°C.

1. Pipet 150 µL of the assay buffer into the NSB (non-specific binding) wells.
2. Pipet 100 µL of the assay buffer into the Bo (0 pg/mL standard) wells.
3. Pipet 100 µL of Standards #1 through #7 to the bottom of the appropriate wells.
4. Pipet 100 µL of the samples to the bottom of the appropriate wells.
5. Pipet 50 µL of the blue conjugate into each well except the TA and Blank wells.
6. Pipet 50 µL of the yellow antibody into each well except the Blank, TA, and NSB wells.

Note: Every well used should be green in color except the NSB wells which should be blue. The Blank and TA wells are empty at this point and have no color.

7. Seal the plate. Incubate at room temperature with shaking (~500 rpm*) for two hours.
8. Empty the contents of the wells and wash by adding 400 µL of wash buffer to every well. Repeat 2 more times for a total of 3 washes. After the final wash, empty or aspirate the wells and firmly tap the plate on a lint free paper towel to remove any remaining wash buffer.
9. Pipet 5 µL of the blue conjugate (diluted 1:2) to the TA wells.
10. Add 200 µL of the substrate solution into each well.
11. Incubate for 1 hour at room temperature without shaking.
12. Pipet 50 µL stop solution into each well.
13. After blanking the plate reader against the substrate blank, read optical density at 405 nm. If plate reader is not capable of adjusting for the blank, manually subtract the mean OD of the substrate blank from all readings.

* The optimal speed for each shaker will vary and may range from 120-700 rpm. The speed must be set to ensure adequate mixing of the wells, but not so vigorously that the contents of the wells splash out and contaminate other wells.
Calculation of Results

Several options are available for the calculation of the concentration of Estradiol-17β in the samples. We recommend that the data be handled by an immunoassay software package utilizing a 4 parameter logistic curve fitting program. If data reduction software is not readily available, the concentration of Estradiol-17β can be calculated as follows:

1. Calculate the average net OD for each standard and sample by subtracting the average NSB OD from the average OD for each standard and sample.

   \[
   \text{Average Net OD} = \text{Average OD} - \text{Average NSB OD}
   \]

2. Calculate the binding of each pair of standard wells as a percentage of the maximum binding wells (Bo), using the following formula:

   \[
   \text{Percent Bound} = \frac{\text{Net OD}}{\text{Net Bo OD}} \times 100
   \]

3. Plot the Percent Bound (B/Bo) versus concentration of Estradiol-17β for the standards. Approximate a straight line through the points. The concentration of Estradiol-17β of the unknowns can be determined by interpolation.

Samples with concentrations outside of the standard curve range will need to be re-analyzed using a different dilution.
**Typical Results**

The results shown below are for illustration only and should not be used to calculate results from another assay.

Performance Characteristics

Specificity

The cross reactivities for a number of related compounds were determined by diluting the cross reactants in the kit assay buffer at a concentration of 100, 10, 1, and 0.1 times the high standard. These samples were then measured in the assay.

<table>

Sensitivity

The sensitivity or limit of detection of the assay is 14.0 pg/mL. The sensitivity was determined by interpolation at 2 standard deviations below the mean signal at maximal binding (0 ng/mL) using data from 6 standard curves.

Linearity

Human serum and plasma was serially diluted 1:2 in the kit assay buffer and measured in the assay. The results are shown in the table below.
Precision

Intra-assay precision was determined by assaying 20 replicates of three buffer controls containing Estradiol-17β in a single assay.

<table>
